

C8_research articles vs review articles

Professional communication

Research (original) articles vs
review articles

Professional communication

- The discourse community
- The communication needs
- The situation/context of communication

Professional communication

- Many similar encounters (same purpose, participants, situation, etc.) – patterns of texts/typified texts=genres;
 - E.g. user guides
- Genres/types of texts – oral or written;
- Review articles, news articles, (scientific) research articles are written genres

Objectives of professional texts in science

- to present research results and create new knowledge in the field (research article, research proposal, scientific poster);
- to present and evaluate research results (review articles);
- to teach established knowledge in the field (textbook, lab manual);

Research articles

- The most complex genre in professional and academic communication
- A very formalized kind of scientific article
- Produced and consumed by a knowledgeable to expert professional community

Research articles vs review articles

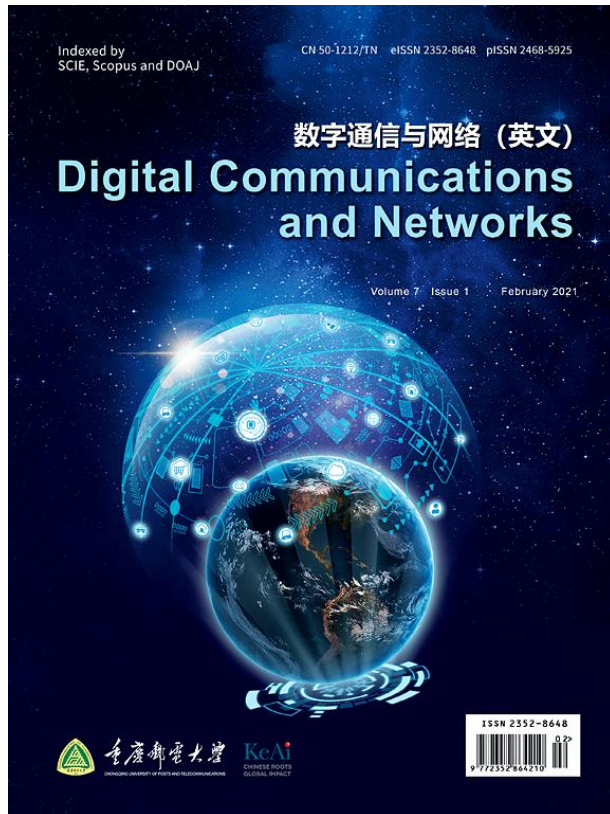

- Research components:
 - Hypothesis/theory
 - Testing hypothesis – experimenting
 - Data collection
 - Data interpretation
- A research article reports all these from a 1st person perspective;
- A review article reports *what others have done* – collects data from research done by others and summarizes, evaluates and reports them.

Research article vs review article

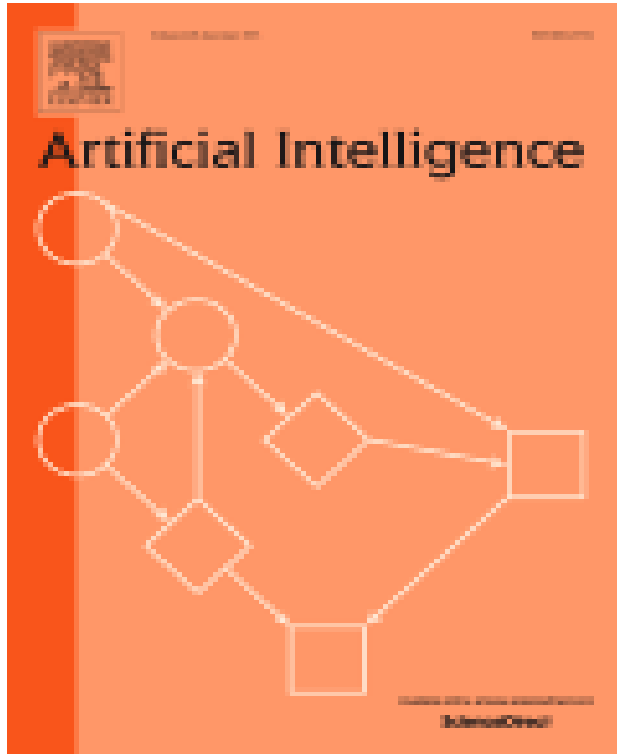

- Research articles are written by the researchers who did that specific research;
- Review articles are written by other people than the researchers (journalists, other researchers, etc.);
- Research articles *add to the knowledge* in the field with their data;
- Review articles *put order/ evaluate the existing knowledge* in the field.

[Digital Communications and Networks](#), fully open accessed by ScienceDirect, publishes rigorously peer-reviewed and **high quality original articles** and **authoritative reviews** that focus on communication systems and networks. Conference papers may be accepted if they have been substantially extended. Special issues of the journal that focus on a particular aspect of the field are also published from time to time.

[Artificial Intelligence](#), which commenced publication in 1970, is now the generally accepted premier international forum for the publication of results of current research in this field. The journal welcomes foundational and applied papers describing mature work involving computational accounts of aspects of **intelligence**.

The journal reports results achieved; proposals for new ways of looking at **AI** problems must include demonstrations of effectiveness. Papers describing systems or architectures integrating multiple technologies are welcomed. *Artificial Intelligence (AIJ)* also invites papers on applications, which should describe a principled solution, emphasize its novelty, and present an in-depth evaluation of the AI techniques being exploited. The journal publishes an annual issue devoted to survey articles and also hosts a "competition section" devoted to reporting results from AI competitions.
