

Să se găsească formula de cuadratură de grad maxim de exactitate de forma

$$\int_0^2 e^x f(x) dx = A_0 f(x_0) + R(f)$$

și să se dea o evaluare a restului dacă $f \in C^2[0,2]$

Rezolvare:

$$f = x^0 = 1$$

$$\int_0^2 e^x \cdot 1 dx = A_0 \Leftrightarrow e^x \Big|_0^2 = A_0 \Rightarrow A_0 = e^2 - 1$$

$$f := x^1$$

$$\int_0^2 x e^x dx = A_0 x_0 \Leftrightarrow x e^x \Big|_0^2 - \int_0^2 e^x dx = (e^2 - 1) x_0$$

$$\Leftrightarrow 2e^2 - 0 - e^2 + 1 = (e^2 - 1) x_0 \Leftrightarrow e^2 + 1 = (e^2 - 1) x_0$$

$$\Rightarrow x_0 = \frac{e^2 + 1}{e^2 - 1}$$

$$\int_0^2 e^x f(x) dx = (e^2 - 1) f\left(\frac{e^2 + 1}{e^2 - 1}\right) + R(f)$$

Pentru x_0 și A_0 astfel definiți avem $R(1) = R(x) = 0$

$$f = x^2$$

$$\int_0^2 x^2 e^x dx = (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1}\right)^2 + R(x^2)$$

$$\Rightarrow R(x^2) = \int_0^2 x^2 e^x dx - \frac{(e^2 + 1)^2}{e^2 - 1} = x^2 e^x \Big|_0^2 - 2 \int_0^2 x e^x dx - \frac{(e^2 + 1)^2}{e^2 - 1} = 4e^2 - 2(e^2 + 1) - \frac{(e^2 + 1)^2}{e^2 - 1} =$$

$$= \frac{[2(e^2 - 1)^2 - (e^2 + 1)^2]}{e^2 - 1} = \frac{2e^4 - 4e^2 + 2 - e^4 - 2e^2 - 1}{e^2 - 1} =$$

$$= \frac{e^4 - 6e^2 + 1}{e^2 - 1} \neq 0 \Rightarrow R(x^2) \neq 0$$

$\Rightarrow$ gradul de exactitate este 1

$\neq L =$

Pentru determinarea restului folosim teorema lui

Peano:

" $L: C^m[a, b] \rightarrow \mathbb{R}$ o funcțională cu proprietatea că
 $L(P) = 0 \quad \forall P \in \Pi_{m-1} \quad (\ker(L) = \Pi_{m-1})$

Atunci

$$L(f) = \int_a^b K(t) f^{(m)}(t) dt$$

unde

$$K(t) = \frac{1}{(m-1)!} L((x-t)_+^{m-1}) \quad \text{-- nucleul Peano}$$

Mai mult, dacă nucleul $K(t)$ păstrează semn constant pe $[a, b]$ atunci $\exists \xi \in [a, b]$ a.t.

$$L(f) = \frac{f^{(m)}(\xi)}{m!} L(x^m) \quad "$$

În cazul nostru

$$R(f) = \int_0^2 e^x f(x) dx - (e^2 - 1) f\left(\frac{e^2 + 1}{e^2 - 1}\right)$$

$$\text{și } \ker(R) = \Pi_1 \Rightarrow m-1 = 1 \Rightarrow m = 2$$

$$\Rightarrow R(f) = \int_0^2 K(t) f''(t) dt$$

$$\text{unde } K(t) = \frac{1}{(2-1)!} R((x-t)_+^{2-1}) = R((x-t)_+) =$$

$$= \int_0^2 e^x (x-t)_+ dx - (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1} - t \right)_+ =$$

$$= \underbrace{\int_0^t e^x (x-t)_+ dx}_{=0} + \underbrace{\int_t^2 e^x (x-t)_+ dx}_{=x-t} - (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1} - t \right)_+ =$$

$$= \int_t^2 e^x (x-t) dx - (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1} - t \right)_+ = \int_t^2 x e^x dx -$$

$$- t \int_t^2 e^x dx - (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1} - t \right)_+ = x e^x \Big|_t^2 - \int_t^2 e^x dx -$$

$$- t e^x \Big|_t^2 - (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1} - t \right)_+ =$$

$$= 2e^2 - \cancel{te^t} - e^2 + e^t - \cancel{te^2} + \cancel{te^t} -$$

$$- (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1} - t \right) = e^2 + e^t - te^2 - (e^2 - 1) \left(\frac{e^2 + 1}{e^2 - 1} - t \right)$$

$$= e^2 + e^t - te^2 - e^2 - 1 + (e^2 - 1)t$$

$$= \begin{cases} e^2 + e^t - te^2, & t > \frac{e^2 + 1}{e^2 - 1} \\ e^2 + e^t - te^2 - e^2 - 1 + (e^2 - 1)t, & t < \frac{e^2 + 1}{e^2 - 1} \end{cases}$$

$$= \begin{cases} e^2 + e^t - te^2, & t > \frac{e^2 + 1}{e^2 - 1} \\ e^t - 1 + t, & t < \frac{e^2 + 1}{e^2 - 1} \end{cases} \geq 0 \quad \forall t \in [0, 2]$$

$\Rightarrow k(t)$ păstrează semn constant pe $[0, 2] \Rightarrow \exists \zeta \in [0, 2]$ a.i.

$$\Rightarrow R(f) = \frac{f^{(2)}(\zeta)}{2!} R(x^2) = \frac{e^{\zeta} - 6e^2 + 1}{2(e^2 - 1)} f''(\zeta)$$

Aceeași problemă pentru

$$\int_0^1 x^2 f(x) dx = A_0 f(x_0) + R(f)$$

$$f = x^0 = 1 \quad \int_0^1 x^2 \cdot 1 dx = A_0 \cdot 1 \Rightarrow \frac{x^3}{3} \Big|_0^1 = A_0$$

$$f = x^1 \quad \int_0^1 x^2 \cdot x dx = A_0 x_0 \Rightarrow \frac{x^4}{4} \Big|_0^1 = A_0 x_0$$

$$\Rightarrow \begin{cases} A_0 = \frac{1}{3} \\ A_0 x_0 = \frac{1}{4} \end{cases} \Leftrightarrow \begin{cases} A_0 = \frac{1}{3} \\ \frac{1}{3} x_0 = \frac{1}{4} \end{cases} \Rightarrow \begin{cases} A_0 = \frac{1}{3} \\ x_0 = \frac{3}{4} \end{cases}$$

$$\int_0^1 x^2 f(x) dx = \frac{1}{3} f\left(\frac{3}{4}\right) + R(f)$$

Pentru x_0 și A_0 astfel definiți avem $R(1) = R(x) = 0$

$$f = x^2 \quad \int_0^1 x^2 \cdot x^2 dx = \frac{1}{3} \left(\frac{3}{4}\right)^2 + R(x^2)$$

$$\Rightarrow \frac{x^5}{5} \Big|_0^1 = \frac{3}{16} + R(x^2) \Rightarrow R(x^2) = \frac{1}{5} - \frac{3}{16} = \frac{1}{80} \neq 0$$

$\Rightarrow$ gradul de exactitate este 1

Pt a determina restul folosim teorema lui Peano
În cazul nostru

$$R(f) = \int_0^1 x^2 f(x) - \frac{1}{3} f\left(\frac{3}{4}\right)$$

$$\text{și } \ker(R) = \Pi_1 \Rightarrow m-1=1 \Rightarrow m=2$$

$$\Rightarrow R(f) = \int_0^1 K(t) f''(t) dt$$

$$\text{unde } K(t) = \frac{1}{(2-1)!} R((x-t)_+^{2-1}) = R((x-t)_+) =$$

$$= \int_0^1 x^2 (x-t)_+ dx - \frac{1}{3} \left(\frac{3}{4} - t\right)_+ = \int_0^t x^2 (x-t)_+ dx + \int_t^1 x^2 (x-t)_+ dx - \frac{1}{3} \left(\frac{3}{4} - t\right)_+$$

$$+ \int_t^1 x^2 (x-t)_+ dx - \frac{1}{3} \left(\frac{3}{4} - t\right)_+ = \int_t^1 x^2 (x-t) dx - \frac{1}{3} \left(\frac{3}{4} - t\right)_+ =$$

$$= \int_t^1 x^2 dx - t \int_t^1 x dx - \frac{1}{3} \left(\frac{3}{4} - t\right)_+ =$$

$$= \frac{x^3}{3} \Big|_t^1 - t \frac{x^2}{2} \Big|_t^1 - \frac{1}{3} \left(\frac{3}{4} - t\right)_+ = \frac{1}{3} - \frac{t^3}{3} - \frac{t}{3} + \frac{t^2}{3} -$$

$$- \frac{1}{3} \left(\frac{3}{4} - t\right)_+ = \frac{1}{3} - \frac{t}{3} + \frac{t^2}{3} - \frac{1}{3} \left(\frac{3}{4} - t\right)_+ =$$

$$= \begin{cases} \frac{1}{3} - \frac{t}{3} + \frac{t^2}{3}, & t \geq \frac{3}{4} \\ \frac{1}{3} - \frac{t}{3} + \frac{t^2}{3} - \frac{1}{3} + \frac{t}{3}, & t \in [0, \frac{3}{4}) \end{cases} = \begin{cases} \frac{3-4t+t^2}{3}, & t \geq \frac{3}{4} \\ \frac{t^2}{3}, & t \in [0, \frac{3}{4}) \end{cases}$$

$K(t) \geq 0 \Rightarrow K(t)$ păstrează semn constant pe $[0, 1]$

$$\Rightarrow \exists \eta \in [0, 1] \text{ a.i. } R(f) = \frac{f^{(2)}(\eta)}{2!} R(x^2) = \frac{1}{160} f''(\eta)$$
